PREFACE

Traffic volume information is used by many people to assist them in assessing the viability of business proposals, land use options, marketing, advertising, and a host of other activities. This publication, **Traffic Volumes 1987**, provides annual and seasonal averages for selected links in the provincial highway network and overall system indicators. Many undertakings start with this macro overview or picture of the traffic volume demand.

For more comprehensive view, the **Transportation Capital Branch** issues the Historical, Short-Term Traffic Projections and Permanent Counting Station Annual reports. Also, site or time specific information can be obtained from the **Regional Traffic Sections** who conduct the data collection.

In 1987, the overall system summaries in Part I of this report indicate that the growth in travel demand from 1986 is one of the largest recorded on the provincial highway network. The majority of this growth was found on the freeway system in Southern Ontario. Even though a greater increase was found outside of the Greater Toronto Area (GTA), the 1987 travel experience in the GTA totals 46.8% of the total 21.2 billion kilometres of freeway travel.

An increase in the total number of recorded accidents was observed in 1987 over 1986. However, the substantial growth in travel experience produced lower accident rates on Freeways and Secondary Highways and no change in the rate on King's Highways. The accident rates shown for the Provincial Total and 'Other Roads' could be misleading since they are calculated from taxable fuel consumption. The rate of consumption used in the calculations has not been adjusted by the Federal Government.

Some highway routes which have not yet been assigned an official highway number, such as the E.C. Rowe Expressway or the Sudbury Southwest Bypass, are shown in Part II under the section titled Selected 7000 Series Highways.

Selected 7000 Series Highways II - 182

INTRODUCTION

This publication contains information pertaining to traffic volumes and accident rates on roads under Provincial jurisdiction as of December 31, 1987. The book is divided into two parts.

PART I

The information in this part is included for policy analysis and program planning purposes. It includes summaries about the overall Provincial Highways system and not specifics related to individual volume sections. The system indicators are developed from travel experience, accident data and highway geometrics.

PART II

The information in this part is a detailed listing of traffic volumes on Provincial Highways, section by section.

The highway network is divided into 2,718 sections for reporting purposes. Seasonal traffic volume variations are estimated for each section reported. Although local conditions cause variations in the volume within the sections, the volumes shown are considered to adequately represent the section.

On highways possessing more than one route number, such as Highways 35 and 115, the volume information is referenced to the lower number highway. When an overlap occurs between a freeway and non-freeway, reference is made to the freeway route number. The freeways are Highways 400 to 427 and the Q. E. W.

The following is a KEY to reading the listings:

LOCATION DESCRIPTION

A statement identifying the start or ending of a section. Frequently used abbreviations (over the commonly known) include:

IC : Interchange
JCT : junction
LTS : limits
BDY/BDRY : boundary
TWP : township
CORS : corners
REG : regional
BR : bridge
C : concession
CTY : county
L : lot
R : river
O'LAP : overlap

DISTANCE (KM)

The length of the section in kilometres reported to one decimal place.

PATTERN TYPE

One of 14 pattern types that represent the seasonal variability of the traffic flow on the section indicated.

The 14 pattern types represent the traffic flow variation on the whole network. They include:

1. UC : urban commuter
2. SC : suburban commuter
3. C : commuter
4. IC : intermediate commuter
5. CR : commuter recreation
6. IR : intermediate recreation
7. CTR : commuter - tourist - recreation
8. IT : intermediate tourist
9. LT : low tourist
10. T : tourist
11. HT : high tourist
12. LR : low recreation
13. R : recreation
14. HR : high recreation

The first three are generally referred to as Low Variation Curves (or Commuter Travel); the next five as Intermediate Variation Curves (a blend of all types of traffic); and the last six as High Variation Curves. For this last group, the first three represent tourist travel and the second three, recreational travel; this sub-grouping is distinguished by the relationship of weekend to weekday traffic.

A graphical presentation of these pattern types has been included on the following page.

AADT

Annual Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period January 1st to December 31st.

SADT

Summer Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st. including weekends.

SAWDT

Summer Average Weekday Daily Traffic; defined as the average twenty-four hour, two-way, weekday traffic for the period July1st to Aug 31st, excluding weekends. Weekend traffic is defined to start at noon on Friday and end at noon on Monday for a normal short weekend.

A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.

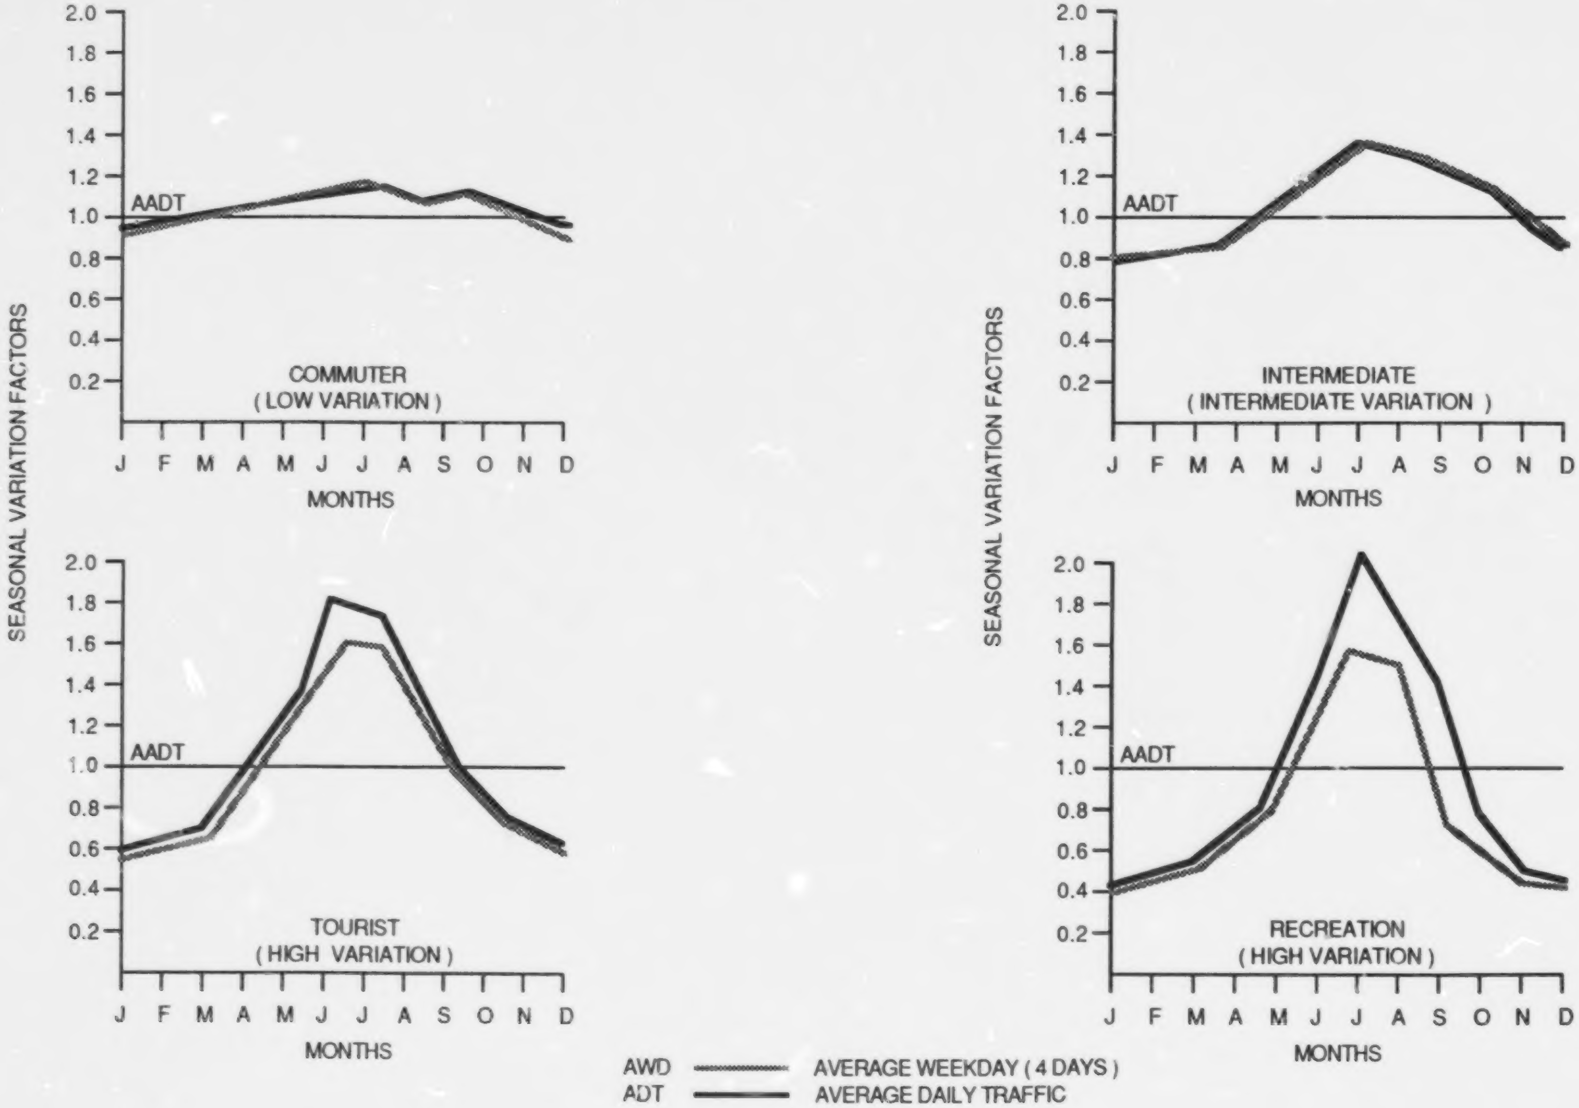
WADT

Winter Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period December 1st to March 31st including weekends.

PART I

Overall System Summaries

PATTERN TYPES VARIATION CURVES



AR

Accident Rate; which is defined as the number of reportable accidents occurring annually on a particular highway section for every million vehicle kilometres (Mv - km) travelled on that section during the same period. "Reportable Accidents" are those causing any death, injury or damage exceeding a certain established amount. In 1978, the damage amount was increased from $200 to $400, and in 1985 from $400 to $700.

Mathematically, the accident rate is calculated as follows:

AR = the number of accidents for a given year divided by the Mv - km, noting the following:

a. Multiple vehicle collisions (i.e., chain reactions are generally considered as one accident unless the reporting police officer decides otherwise).

b. Accidents on freeway ramps are totally excluded from sectional and total system accident rate calculations.

c. The Mv - km is calculated as follows:

$$\text{Mv - km} = \frac{\text{AADT} \times 365 \text{ days} \times \text{DIST (km)}}{1{,}000{,}000}$$

If no accidents have occured on a given section, the accident rate is shown as blank, not zero.

NOTE

The user of this publication should realize that the reported data are 'estimated values'. Since traffic volumes are not static, direct field measurements are accurate only for the time of the count. Also, the size of the Provincial Highway network makes it impractical to measure each section annually. Thus, approximately one third of the reported sections are counted each year. The following three methods of measuring traffic volumes are employed:

1. Permanent Counting Stations: At twenty-four locations across the Province counts are taken for each hour of the year.
2. Inventory Counting Stations: Each unique volume section has a set location where traffic volumes are sampled on a cyclical basis by season and year.
3. Request Counting Stations: Traffic volumes are measured at random locations as needed to address operational or planning concerns.

Using the available traffic volume information and historical trends, estimates are made for each volume section.

TRAFFIC VOLUME AND SAFETY HIGHLIGHTS

- Travel experience on Provincial highways shows the largest ever single year increase at 8.1% or 3.05 billion kilometres of travel.

- Growth in travel on the Freeway system was highest and accounted for more than half of the total increase on Provincial highways.

- For the first time since 1976 growth in travel on the King's highways almost equalled the growth found on the Freeway system.

- Secondary highways are also contributing to the overall travel growth with a remarkable increase of 3.1%

- Caution should be exercised in the use of the travel experience and accident rates for both Provincial Total and Other Roads. The fleet rate used to determining travel experience from taxable fuel sales as set by the Federal Government still has not been adjusted. The MVKM which appears underestimated, results in distortion of the trends.

- Although total accidents on the Provincial highways have increased the accident rates dropped for Freeways and Secondary highways and remained unchanged on the King's
